

Numerical deviation versus the certified envelope $E(t) = \frac{\xi}{\Phi}(1 - e^{-\Phi t})$

full scale: the ceiling $\mathcal{U}\xi = \xi/\Phi \approx 0.38730$
is about $9 \times$ the true error

unused
margin

$R - \mathcal{L}$ and $\mathcal{H} - R$ almost coincide
(they differ by 2×10^{-4} at τ^*)

$E(\tau^*) \approx 0.04214$

$\max |\mathcal{B}_{\text{osc}} - R| \approx 0.01738$ at $t \approx 0.59252$
envelope there: $E \approx 0.02852$
